Brief Description

The Document Centre DocuShare Direct Module (DCDS Module™) provides a simple method to capture documents and entire folders. The basic template provides auto indexing of up to six fields of data which designate the location and description of the document or file and automatically places the document in the correct collection within DocuShare in TIFF or PDF format. By simply setting up templates using the 6 or 12 template version and typing or predefining the collection name in which you wish to place the document, the sub-collection, and the document name, date and keywords you can use the selected template to send your document using your Document Centre or WorkCentre directly to DocuShare. The document is scanned and placed directly in the DocuShare Document Management repository exactly where you want it.

Full Description

DCDS Module™ is designed to allow end-users to scan hard copy documents from a scan enabled Xerox Document Centre or WorkCentre to a document repository in DocuShare. This module enables the meta-data functionality of the Document Centre and WorkCentre products to tag and archive hard copy documents into DocuShare.

DCDS Module™ can be configured to monitor six or twelve Document Centre scanning locations (FTP directories) and move the scanned documents from these directories to up to six or twelve DocuShare servers or six locations within a single DocuShare server based on the Template Settings.

If the collection or sub-collection does not already exist, the module will automatically create and assign general permissions for collections, sub-collections, and document permissions based on the next level up where the document is placed. For operations where predefined collections and template coversheets can be established this becomes a very simple and economical way to quickly digitize and store your records.
